Letter of Introduction

Louis H. Coyle II

Portland, Maine • lhcoyle4@gmail.com • github.com/lhcoyle4 • August 2026

Dear Hiring Manager,

This portfolio is my résumé in long form: a short summary, a timeline, some charts, and the projects behind them. The short version is sixteen years of hands-on technical work — five IT roles, three promotions — organized around one habit: put correctly configured hardware in front of the people who need it, and keep honest records of where every asset goes.

Most recently I spent nearly four years as the desktop technician for a research-administration office at the University of Southern Maine: provisioning, configuring, troubleshooting, and inventorying assigned and loaner hardware, with support delivered by ticket, phone, email, and walk-up. My imaging experience goes back further — PXE network-boot reimaging at ResNet in Boston, backup-image management at the University of Maine's Fogler Library — and my paperwork discipline was learned at Tilson Technology Management, where I coordinated daily data among Engineering, CAD, and Surveying teams, tracked applications and invoices, and was promoted twice in two years. One story says the most about how I work: USM had no funded asset-management platform, so I kept the inventory by hand — a structured spreadsheet reconciled on every storeroom visit, backed by photographs — while making the case for proper tooling.

Two things round out the profile. I hold a B.S. in Computer Science — I went to school to demystify computers, and I have — and it mostly shows up as a habit of scripting away repetitive steps: Python tooling I wrote at Tilson replaced a multi-hour daily manual routine. And a graduate certificate in GIS keeps the work connected to the physical world: drone photogrammetry, remote sensing, and field data collection. I am at my best where the technical work has a real-world counterpart — machines on desks, fiber on poles, terrain under a flight path.

I am a U.S. citizen, based in Portland, Maine, and open to relocation for the right role. Patience with stressed, non-technical users, comfort lifting and moving equipment, and a preference for work that is not spent seated all come standard — *solvitur ambulando*: it is solved by walking. Thank you for your time; the rest of the portfolio is the evidence.

Sincerely,

Louis H. Coyle II

Qualification Summary

IT Operations • Deployment & Desktop Support • Software • GIS

Louis H. Coyle II

Portland, Maine • lhcoyle4@gmail.com • github.com/lhcoyle4 • August 2026

Abstract—Five IT roles spanning 2009–2025 share a single through-line: put correctly configured hardware in front of the people who need it, and keep honest records of where every asset goes. Most recently: nearly four years of desktop support at the University of Southern Maine — provisioning, deployment, troubleshooting, and inventory for departmental and loaner fleets. Earlier roles added PXE and image-based Windows redeployment, rack-and-workstation installation, and two promotions in two years at a telecom infrastructure firm. A B.S. in Computer Science, a GIS graduate certificate, and a habit of automating repetitive work round out the profile. U.S. citizen; based in Portland, Maine.

1. CAPABILITY OVERVIEW

Deployment, configuration, and support of end-user equipment. Nearly four years at the University of Southern Maine (Oct 2021–May 2025) provisioning, configuring, and supporting assigned and loaner desktops, laptops, monitors, and peripherals for a research-administration office — preparation, issue, recovery, and re-provisioning of loaners — plus web-conferencing, AV, backup, and malware support by ticket, phone, email, and walk-up.

Imaging and rebuild workflows. Windows imaging from manual installation-media rebuilds to automated PXE network-boot reimaging (ResNet, Boston), plus creation and management of backup images for the public PC fleet at Fogler Library (Univ. of Maine). Comfortable taking a machine from bare metal to configured, verified, and documented.

Inventory and asset accountability. Maintained the hardware inventory at USM. With no funded asset-management platform available, built the discipline by hand: a structured inventory spreadsheet reconciled on every storeroom visit, backed by photographic records — and made the case for a proper barcode asset-management system.

Coordination and documentation. Three roles in 27 months at Tilson Technology Management (Inc. 5000 telecom firm): OSP Desktop Technician, promoted to OSP Desktop Coordinator, promoted to Licensing Coordinator. Coordinated daily data handoffs among Engineering, CAD, and Surveying teams; created and tracked utility-pole and conduit applications; verified construction invoices; trained new hires.

Customer service. Front-line support in every IT role: ticket queues and walk-ups at USM, students at ResNet, and 24/7 on-call support for Seacoast Security. Customer-facing work predates the IT career (retail, dining) — patience with stressed, non-technical users is long-practiced habit, not a line item.

The physical half of the work. Installed servers, PCs, and printers during an office-wide technology overhaul at Seacoast Security; rewired and cleaned server racks; years of component-level builds for employers, friends, and personal use. A daily cyclist — comfortable lifting and moving equipment, and happier in a role that moves.

Software, automation, and spatial data. A B.S. in Computer Science applied to floor-level problems: Python tooling at Tilson replaced a multi-hour daily manual routine, and where a workflow contains a repetitive manual step, it tends to get scripted. A GIS graduate certificate carries the skills outdoors — drone photogrammetry, remote sensing, and field data collection (projects on page 6).

2. EMPLOYMENT SUMMARY

Oct 2021 – May 2025	Desktop Technician, Grants & Contracts (promoted from IT Specialist CL3)	Univ. of Southern Maine, Portland, ME
Feb 2018 – May 2020	OSP Desktop Technician → OSP Coordinator → Licensing Coordinator	Tilson Technology Mgmt., Portland, ME
2015 – 2016	IT Technician	Fogler Library, Univ. of Maine, Orono, ME
2010 – 2012	IT Specialist	Seacoast Security, W. Rockport, ME
2009 – 2010	IT Technician	ResNet, Boston, MA

3. TOOLS AND SYSTEMS

Environments: Windows client environments; Microsoft Office (Outlook, Word, Excel); web-conferencing and AV platforms. **Ticketing/workflow:** TeamDynamix, Jira, Salesforce. **Deployment:** PXE network-boot and image-based OS installation; backup-image management. **Scripting:** Python, PowerShell, Bash, Excel/VBA automation. **GIS & field:** ArcGIS Pro, QGIS, Survey123/QField, SNAP, Pix4D. **Hardware:** component-level assembly; monitor, printer, and peripheral setup and troubleshooting; server racking and cabling.

4. EDUCATION

B.S., Computer Science (2024) and Graduate Certificate, Geographic Information Systems (2025), both University of Southern Maine. Prior coursework toward a B.S. in Computer Engineering: DigiPen (79 cr.) and University of Maine (37 cr.).

5. AVAILABILITY

U.S. citizen. Based in Portland, Maine, and open to relocation for the right role. References available on request.

III. Career Timeline

Employment and education, 2009–2026. All entries verifiable; detail on pages 2–3.

Figure 1. Sixteen years from first help desk to enterprise desktop support, with degrees earned mid-career. Up-arrows (↑) mark promotions: two at Tilson, one to a salaried role at USM.

Three things this picture says that prose under-sells. First, the IT work came *before* the degree: by the time I enrolled in USM’s computer science program I had already spent six years being handed broken, unimaged, or unprovisioned machines and returning them working. The education formalized habits the help desk taught. Second, the two promotion arrows at Tilson and the salaried promotion at USM are the pattern, not the exception — every multi-year role here ended senior to where it began. Third, the work keeps returning to the same loop drawn on the title page: prepare, deploy, support, recover. Most of the work I do best lives somewhere on that loop.

Figure 2. The loaner-fleet cycle I ran at USM, 2021–2025 — the cycle at the heart of deployment and support work.

IV. Technical Capabilities

What the tools are, how well I drive them, and where each was used in anger.

Figure 3. Tool proficiency, self-assessed on a 1–5 scale — reproduced unchanged from my own records.

CAPABILITY DETAIL

OS & environments	Windows client environments across all five IT roles; Linux and macOS familiarity; component-level hardware throughout.
Office & collaboration	Microsoft Office (Outlook, Word, Excel); web-conferencing and AV support delivered to end users at USM.
Ticketing & workflow	TeamDynamix, Jira, and Salesforce across roles; ticket, phone, email, and walk-up queues at USM.
Imaging & deployment	PXE network-boot reimaging (ResNet); backup-image creation and management (Fogler Library); manual installation-media rebuilds everywhere else.
Scripting & automation	Python, PowerShell, Bash, Excel/VBA; used at Tilson to replace a multi-hour daily manual routine and to cut team data-entry time.
Hardware & physical	Component-level assembly; monitor, printer, and peripheral setup and troubleshooting; server racking and cabling; office-wide equipment overhaul (Seacoast Security).

The honest caveat, stated rather than hidden: the ratings above are my own, and a 4 means “I build working tools with this unassisted,” not mastery of every corner of the language. The chart’s real message is the shape — strongest exactly where hands-on IT work lives: scripting for repetitive work, Windows environments, and the office suite the paperwork runs on.

V. Selected Projects & Education

Builds and coursework that show the hands, not just the résumé.

A technician's day is hands on hardware. These projects — personal and academic — are the long version of "comfortable with equipment": machines designed, soldered, flashed, flown, and debugged, then documented.

Project	Built with	What it demonstrates
Path-finding rover, breadboard to soldered board	C, microcontrollers	Hardware assembly from components; iterating a build until it survives handling
High-altitude weather balloon	APRS telemetry, GPS, environment sensors	Field equipment that has to work the first time, far away, untethered
PS/2 keyboard interface + text editor	FPGA	Reading low-level hardware signals; patience with cabling and pinouts
MIDI synthesizer on a microcontroller with no FPU	Embedded C	Making constrained hardware do more than it wants to
Drone survey of granite dikes, York, ME	Pix4D, orthomosaic/DSM	Field data collection, processing, and formal documentation
Flood-inundation model of Portland, ME	ArcGIS Pro	Turning municipal infrastructure data into a decision-ready picture
Chernobyl vegetation-recovery time series	SNAP, satellite imagery	Multi-decade dataset discipline; methodical, documented analysis
Twitter-clone website; sentiment and document classifiers	Python, Django, NLTK, scikit-learn	Software builds carried from empty repo to working product

EDUCATION

2024	B.S., Computer Science — University of Southern Maine	Portland, ME
2025	Graduate Certificate, Geographic Information Systems — University of Southern Maine	Portland, ME
2012–2015	Coursework toward B.S. Computer Engineering — DigiPen Institute of Technology (79 credits)	Redmond, WA
2015–2018	Coursework toward B.S. Computer Engineering — University of Maine (37 credits)	Orono, ME

The engineering coursework at DigiPen and UMaine is listed deliberately: it is where the soldering irons, oscilloscopes, and assembly language live, and it is why hardware on a deployment floor holds no surprises. The computer science degree finished what those years started.
